

iTunes CD Burning

By Daniel J. Wilson

Concept Overview

Eliminate the Browse/Burn Disc button context switching and make the CD burning processes of iTunes and the Finder more similar by redesigning how iTunes handles this task.

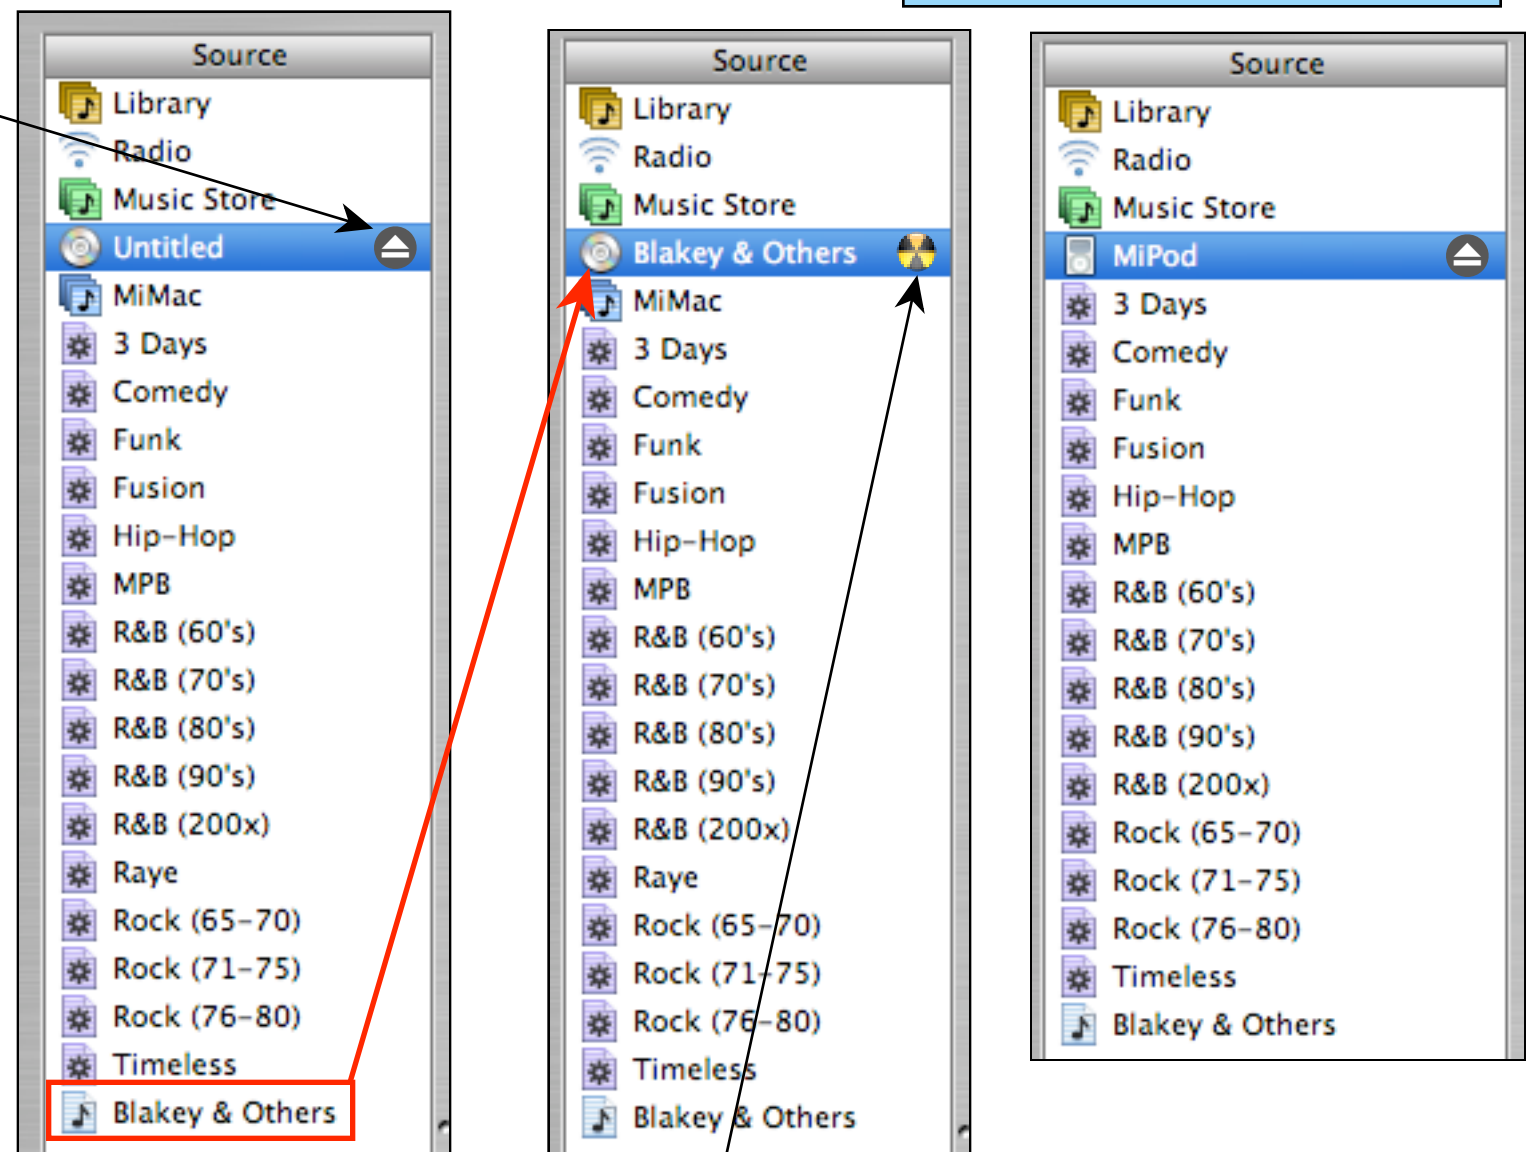

Until the user adds a valid item to the disc, it displays the Eject button.

Pros

- Makes iTunes consistent with the Finder's burning interface
- Less mousing to eject media and devices

Cons

- Eliminates the UI starting point for the CD burning process
- Burn presents a much smaller target to users

The Eject button would also appear for portable audio players. The remaining buttons would shift to the right.

Once a user drags a playlist or song(s) to the disc, the Burn button appears.
